Dinosaurian hands which have only three fingers, which would have been adequate for all purposes even high tech, if they had developed technology similar or superior to ours. Dinosaurian is very 'humanoid' in many ways.

If the dinosaurs had survived to today then it is very unlikely that humans would have evolved at all.

SCALES OR FEATHERS?

Troodon was highly intelligent having excellent vision and was probably a night hunter, all of which points to it being a warm-blooded animal. It would have preyed on small mammals, snakes, lizards and young dinosaurs. Troodon means 'wounding tooth' after the original tooth found in the 1850s. It was not until 130 years later that bones were found to give a better knowledge of the dinosaur.

Initially Troodon was portrayed with a reptilian skin as is shown in the reconstruction on the far right. However more recent evidence has led to new interpretations as a feathered dinosaur. The two reconstructions, on a female (far left) and a male (centre) depict this. Why feathers were not for flight but to insulate the dinosaur, would have been especially important if it was warm-blooded.
